7 October 2026

OpenFn's shift from project-shaped consulting to subscription-centred Services is what caught my attention about the Managing Director role. My career has repeatedly sat between technical delivery, operating-model design and executive leadership in environments where several organisations and systems must work together.

I have direct experience with the public-service contexts OpenFn serves. At GenKey, I worked on Ghana's national biometric voter-registration programme, including ABIS software, the voter-register adjudication product and direct technical engagement with the Electoral Commission. At Living Goods, I led software engineering for digital-health direct operations and technical-assistance programmes across Africa. Earlier consulting work included a mobile field-data platform used by NGOs and development organisations.

I have also spent much of my career building and leading the organisations that deliver these systems. At Radio Africa I led a 12-person shared-services team. At Living Goods, Peach and Bridge I hired and managed Engineering Managers and multi-disciplinary delivery teams. At Peach and Bridge I had direct responsibility for budgets, delivery costs and financial targets alongside product and technology delivery.

Complex scoping and partner work has been a recurring part of these roles. At Bridge I led technical delivery for MTN Group/MFS Africa and KCB integrations. My responsibility in such engagements has been technical feasibility, architecture, scope, timelines and resourcing; commercial price and contract negotiation was handled by other leaders. That is the same boundary I would bring transparently to OpenFn while strengthening the commercial side of the role.

More recently, I have been building AI-enabled products and workflows. I use language models where interpretation and generation improve the system, and deterministic software where transactions, state, rules and reliability must remain authoritative. OpenFn's combination of interoperability, public-service automation and practical AI adoption maps closely to that approach.

The role combines areas I have worked across for two decades: government and NGO technology, integration architecture, leadership of technical managers, delivery discipline and executive strategy. I would welcome the opportunity to discuss how I would approach the Services transition and portfolio at OpenFn.

Many thanks,

Nii Amon
